```
/note="Vector: Lambda TriplEx2; Site_1: Sfi 1A; Site_2: Sfi 1B, Plasmodium vivax field isolate cDNA library made in lambda TriplEx2. Inserts cloned unidirectionally in the Sfi 1A and Sfi 1B sites. Mass excision of library produced inserts in pTriplEx2 plasmid. Inserts sequenced from either 5' or 3' end using TriplEx2 sequencing primer or polydT 24 bp primer respectively."

XhoI; Toxoplasma RH strain tachyzoites were grown In human
foreskin fibroblast cultures in vitro. The library was
originally constructed by K.L. Wan, Cambridge University
cDNAs were synthesized from polyA RNAs by oligo d(T)
priming and directionally cloned into the EcoRi to XhoI
sites of the Lambda Zapil vector using the ZAP-cDNA
synthesis kit (Stratagene). The primary cDNA library was
mass excised as phagemid using ExAssist helper phage
(Stratagene). Phagemid DNA was extracted by
control of the Lambda control of the Lambda control of the Lambda synthesis with the control of the Lambda and hybridized against a pool of
                                                                                                                                                                                                                                                                                              (Stratagene). Phagemid DNA was extracted by phenol-chloroform method, and hybridized against a pool of highly abundant genes which were derived from short-cycle PCR of the primary cDNA library. The normalized library was electroporated into DH10B (GeneHog, Invitrogen, Inc) WARNING: the library contains a small percentage of cDNAs derived from the human host cells."

//noce="Wector: pBluscript SK-; Site l: EcoRI; Site 2:
XhoI; Toxoplasma RH strain tachyzoites were grown in human
foreskin fibroblast cultures in vitro. The library was
originally constructed by K.L.Wan, Cambridge University.
CDNAS were synthesized from polyA RNAs by oligo d(T)
priming and directionally cloned into the EcoRI to XhoI
sites of the Lambda ZapII vector using the ZAP-CDNA
synthesis kit (Stratagene). The primary cDNA library was
mass excised as phagemid using ExAssist helper phage
(Stratagene). Phagemid using ExAssist helper phage
(Stratagene). Phagemid using extesic by
phenol-chloroform method, and hybridized against a pool of
highly abundant genes which were derived from short-cycle
PCR of the primary cDNA library. The normalized library
was electroporated into DH10B (GeneHog, Invitrogen, Inc)
WARNING: the library contains a small percentage of cDNAs
derived from the human host cells."

/dote="Vector: pDNR-LIB; Site_1: Sfi1; Site_2: Sfi1; The cDNA library was constructed by Keliang Tang, and Robert CONA using the template-ewitching PCR method (Creator SWART CDNA, Clontech Inc.). First strand was PCR amplified using the same primer set and the fragments were digested with Sfi1. The fragments were size selected, ligated into vector pDNR_LIB containing directional Sfi1 sites, and electroporated into GC10 competent cells. WARNING: the library contains a small percentage of cDNAs derived from the human host cells."

/note="Vector: pBluscript SK-; Site_1: EcoRI; Site_2:
XhoI; Toxoplasma RH strain tachyzoites were grown in human
foreskin fibroblast cultures in vitro. The library was
originally constructed by K.L.Man, Cambridge University.
cDNAs were synthesized from polyA RNAs by oligo d(T)
priming and directionally cloned into the EcoRI to XhoI
sites of the Lambda ZaplI vector using the ZAP-cDNA
synthesis kit (Stratagene). The primary cDNA library was
mass excised as phagemid using ExAssist helper phage
(Stratagene). Phagemid Using ExAssist helper phage
(Stratagene). Phagemid DNA was extracted by
phenol-chloroform method, and hybridized against a pool of
highly abundant genes which were derived from short-cycle
PCR of the primary cDNA library. The normalized library
was electroporated into DHIOB (GeneHog, Invitrogen, Inc).
WARNING: the library contains a small percentage of cDNAs
derived from the human host cells."

/note="Vector: pBluscript SK-; Site 1: EcoRI; Site 2:
Xhof; Toxoplasma RH strain tachyzoites were grown in human
foreskin fibroblast cultures in vitro. The library was
originally constructed by K.L.Wan, Cambridge University.
cDNAs were synthesized from polyA RNAs by oligo d(T)
priming and directionally cloned into the EcoRI to XhoI
sites of the Lambda ZapII vector using the ZAP-cDNA
synthesis kit (Stratagene). The primary cDNA library was
mass excised as phagemid using ExAssist helper phage
(Stratagene). Phagemid DNA was extracted by
phenol-chloroform method, and hybridized against a pool of
highly abundant genes which were derived from short-cycle
PCR of the primary cDNA library. The normalized library
was electroporated into DH108 (GeneHog, Invitrogen, Inc).

/ clone="Vector: pBluscript SK-; Site 1: EcoRI; Site 2:
xhol; Toxoplasma RH strain tachyzoites were grown in human foreskin fibroblast cultures in vitro. The library was originally constructed by K.L.Wan, Cambridge University.
CDNAs were synthesized from polyA RNAs by oligo d(T)
priming and directionally cloned into the EcoRI to XhoI sites of the Lambda ZapII vector using the ZAP-cDNA synthesis kit (Stratagene). The primary cDNA library was mass excised as phagemid using ExAssist helper phage (Stratagene). Phagemid using ExAssist helper phage (Stratagene). Phagemid DNA was extracted by phenol-chloroform method, and hybridized against a pool of highly abundant genes which were derived from short-cycle PCR of the primary contains a small percentage of cDNAs was electroperated into DH10B (GeneHog, Invitrogen, Inc)
information relating to organism, libraries, or clone availability.

//note="Vector: pBluescript II SK+Vector type: plasmid;
Site_1: EcoRi; Site_2: Xhoi; The cDNA library was
constructed by Keliang Tang, and Robert Cole at Washington
University, cDNA was synthesized from Poly(A) + mRNA using
an oligo-d(T) primer containing a Xhoi site. Following
second strand synthesis, EcoRI adapters were ligated to
the cDNA, and products were size-selected on sephacryl
SSOO. The cDNA were directionally cloned into the
ECORI/Xhoi prepared pBluescript II SK+ vector, and
electroporated into BlectroTen Blue cells (Stratagene).
The library may contain a small percentage of host or
bacterial contaminants."

/clone lib="Tachyzoite cDNA Library was constructed by Kellang Tang, and Robert Cole at Washington University. CDNA was synthesized from Poly(A)+ mRNA using an oligo-d(T) primer containing a XhoI site. Following second strand synthesis, EcoRI adapters were ligated to the CDNA, and products were size-selected on sephacryl S500. The cDNA were directionally cloned into the EcoRI/XhoI prepared pBluescript II SK+ vector, and electroporated into Electropen Blue cells (Stratagene). The library may contain a small percentage of host or bacterial

/note="Vector: pBluscript SK-; Site 1: EcoRi; Site 2:
Xhol; Toxoplasma RH strain tachyzoites were grown In human
foreskin fibroblast cultures in vitro. The library was
originally constructed by K.L.Wan, Cambridge University.
CDNAs were synthesized from polyA RNAs by oligo d(T)
priming and directionally cloned into the EcoRI to Xhol
sites of the Lambda ZapII vector using the ZAP-cDNA
synthesis kit (Stratagene). The primary cDNA library was
synthesis kit (Stratagene). The primary cDNA library was
(Stratagene). Phagemid DNA was extracted by
phenol-chloroform method, and hybridized against a pool of
highly abundant genes which were derived from short-cycle
PCR of the primary cDNA library. The normalized library
was electroporated into DH10B (GeneHag, Inc),
WARNING: the library contains a small percentage of cDNAs
derived from the human host cells."

/note="weetor: pBluescript II SK+, Site 1: ECoRI; Site 2:
XhoI; The cDNA library was constructed by Keliang Tang,
and Robert Cole at Washington University. cDNA was
synthesized from Poly(A) + mRNA using an oligo-d(T) primer
containing a XhoI site. Following second strand synthesis,
ECORI adapters were ligated to the cDNA, and products were
size-selected on sephacryl S500. The cDNA were
directionally cloned into the EcoRI/XhoI prepared
pBluescript II SK+ vector, and electroporated into
ElectroTen Blue cells (Stratagene). The library may
contain a small percentage of host or bacterial
information relating to organism, libraries, or clone availability. Seg primer: -40RP from Gibco
High quality sequence stop: 567.

                                                                                                                                                                                                                                                                                               A cDNA clone (AAT51370), designated EASC2, codes for the 37 kDa lactate dehydrogenase (LDH) (AAW11476) of Eimeria acervulina schizonts. It was isolated from an E. acervulina oocyst cDNA library in phage lambda ZAPII by screening with antibodies raised against isolated LDH protein fraction EASC2. Nucleic acids encoding LDH, or immunologically active portions of it, can be used to produce LDH in host cells or organisms. The recombinant LDH, host organisms, recombinant LDH, host organisms, recombinant wiral vectors or naked LDH bNA can be utilised in vaccines for the protection of poultry against coccidiosis. immunogenic proteins and antibodies to the proteins can be used to inhibit T. gondii oocyst shedding in a cat due to infection with T. gondii. They can be used for preventing T. gondii infection and for preventing the spread of T. gondii infection. They can also be used for detecting T. gondii infection. The detection method can be used to parasite cysts or oocysts in feces, e.g. from enteric apicomplexa oocysts such as Cryptosporidium oocysts and Toxoplasma oocysts

The T. gondii nucleic acid molecules, immunogenic proteins and antibodies to the proteins can be used to inhibit T. gondii occyst shedding in a cat due to infection with T. gondii. They can be used for preventing T. gondii infection and for gondii. They can be used for preventing T. gondii infection. They can also be used for detecting T. gondii infection. They can be used for parasite cysts or occysts in feces, e.g. from enteric apicomplexa occysts such as Cryptosporidium occysts and Toxoplasma occysts

The invention relates to detection of parasite oocysts or cysts in a faeces sample comprising contacting the sample with a solid support, drying and then washing the sample with an aqueous wash solution, adding an aqueous elution solution and eluting DNA from the sample by heating and amplifying by PCR oocyst-Cyst-specific DNA and detecting the amplification products. The method is useful for detecting parasite corysts e.g., enteric appromplexa oocysts such as Cryptosporidium oocysts or Toxoplasma oocysts, or for detecting parasite cysts e.g. diardia cysts. The method is also useful for developing vaccines to prevent oocysts. The present sequence encodes an immunogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    288
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ThrLyslleProGlyLysSerAspLysGluTrpSerArgMetAspLeuLeuProValAsn 107

The invention relates to detection of parasite occysts or cysts in a faeces sample comprising contacting the sample with a solid support, drying and then washing the sample with an aqueous wash solution, adding an aqueous elution solution and eluting DNA from the sample by heating and amplifying by PCR occyst. Specific DNA and detecting the amplification products. The method is useful for detecting parasite occysts e.g., enteric apicomplexa occysts such as Cryptosporidium occysts or Toxoplasma occysts, or for detecting parasite cysts e.g. diardia cysts. The method is also useful for developing vaccines to prevent occyte shedding in cats. The present sequence encodes an immunogenic protein from Toxoplasma gondii
                                                                                                                      Detecting parasite oocysts or cysts in feces, comprises eluting DNA from sample into aqueous solution by heating, amplifying DNA with primers specific for oocysts or cysts being detected, and detecting amplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   168

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated Toxoplasma gondii protein. The protein is useful for inhibit ocysts shedding by cats infected with Toxoplasma gondii. The protein is useful for preventing or ameliorating diseases caused by infection with T. gondii. The nucleic acid can be used as genetic vaccine which encodes the protein. The protein and the nucleic acid are used as diagnostic reagents for detection of T. gondii infection. The present sequence is used in the exemplification of the

```
The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant cauch as maize or soybean. The method of producing a transformed plant cauch as maize or soybean. The method of producing a transformed plant cauch as maize or soybean. The method of producing a plant with the carecombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. CC phynucleotide or polypeptide is useful for improving plants with the captain properties, e.g. improved cold, heat or afrought tolerance, to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the call cycle pathway with plant growth ragilators, increased rate of content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved lighin production or improved algain production or improved algain production or improved algain production or improved lighin production or improved dighin production or improved dighin production or improved dighin production or improved dighin producing a bacterial polynucleotide used in the sequence represents a bacterial polynucleotide used in the scope of the printed specification but was obtained in electronic form part of the printed specification but was obtained in electronic content from USPTO at sequence of that.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
         cold tolerance; heat tolerance; drought tolerance; herbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polynucleotide; gene; ss.

promoter functional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant cell source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant.

The recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with the improved plant properties, e.g. improved cold, heat or drought tolerance, improved plant properties, e.g. improved cold, heat or drought tolerance, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or providing improved plant growth and development under at least one stress providing improved plant growth and development under at least one stress condition, improved plant growth and development under a feast one stress providing improved plant growth and development under a feast one stress providing improved plant growth and development under a feast one stress providing improved plant growth and development under a feast one stress providing improved plant growth and development under a feast one stress providing improved plant growth and development under a feast one stress providing improved plant growth and development under a feast one stress providing improved plant growth and development date for this patent did format from mer of the providence of the invention. Note: The sequence data for this patent did format from the formation of the plant factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention features to a recombinant by construct compitating a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant comprising an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant with the improved plant properties, e.g. improved cold, heat or drought tolerance, improved plant properties, e.g. improved cold, heat or drought tolerance, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress providing improved plant growth and development under at least one stress condition. This sequence represents a bacterial polynucleotide used in the scope of the invention. Note: The sequence data for this patent did form form part of the printed appecification but was obtained in electronic form part of the printed appecification but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant as maize or soybean. The method of producing a transformed plant the such as maize or soybean. The method of producing a transformed plant the transformed plant with the recombinant DNA construct and growing the transforming a plant with the recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for producing plant properties. The recombinant DNA construct is useful for producing plant properties. The recombinant DNA construct is useful for improved plant properties, e.g. improved cold, heat or drought tolerance. The recombination, modified seed oil or protein yield and/or of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or of the cell cycle pathway with plant growth regulators, introgen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condiction, improved plant growth and development under at least one stress condiction, improved plant growth and development under a feast one stress condiction, improved plant growth and development under a feast on by production. This sequence represents a bacterial polynucleotide used in the form part of the properties of the invention of the scope of the invention. Note: The sequence data for this patent did form the form part of the production or improved data for this patent did form.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                            cold tolerance; heat tolerance; drought tolerance; herbicide; osmosis; pathogen tolerance; peet tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polynucleotide; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            invention relates to a recombinant DNA construct comprising
